

Web Development Project Proposal & Specification

Students are required to develop a dynamic web-based application using the Model-View-Controller (MVC) architecture based on the Java web technologies. For this purpose, you are required to prepare a proposal of your targeted project which later will be used to check against your development output. Your project proposal and specification document must include the following details:

1. Introduction to the Target Project

- **Project Title & Overview:** Determine your project title and provide an overview of the dynamic web-based application you are developing.
- **Problem Statement:** Clearly define the problem that your system is aiming to solve.
- *Note:* You are advised not to build a very complicated system for this project.

2. Group Members, Leader & Module Task Distribution

- State your **Group Number** and list the names of all **group members**, including explicitly naming the **Group Leader**. The maximum group size is limited to **three students**.
- **Module Distribution:** EACH group member must be assigned to work on one specific module individually.
- **Mandatory Requirement:** Every module assigned to a member must be able to perform general information management tasks, specifically **CRUD** (Create, Retrieve, Update, and Delete) functions within the web application.

3. USE CASE & Description

- Provide a **Use Case diagram** and **write a description outlining how each group member will manage the data for their respective modules.**
- Ensure that this description clearly demonstrates the CRUD functionalities of each assigned module.
- Your project should have at least 3 modules not including the user registration module.

4. Class Diagram

- Draw the **class diagrams** related to the overall design and structure of your web application.

- This includes planning your database (Model), where you must determine exactly what data needs to be stored and define their specific **data types**.

5. User Interface (UI) Design

- Transform your graphical user interface design into a **wireframe**.
- For your Frontend (View) planning, ensure your design accounts for the use of:
 - **HTML/JSP**: To define the structure of the web page.
 - **CSS**: For the visual styling of the web page.
 - **JavaScript**: To handle input validation.

Important Submission Deadlines:

- **Initial Proposal**: You must submit your proposal (containing Project Title, Group No & Members, Project Overview, and Module of each member) to ePembelajaran by **30 April 2026**.
- **Final Submission**: The complete web-based system source code (including Servlets for Backend/Controller) must be hosted on GitHub, and the URL of your project link in GitHub is submitted to ePembelajaran as a word document by **25 Jun 2026**.
- **Presentation & Demo** : Formal group presentations will be held between **21 June 2026 - 25 June 2026 (according to your group lecturer's decision)**. Students must present the design process, perform a live walk-through demonstration of the CRUD implementation, and explain their codes.
