

Project Proposal & Specification Rubric (1-4 Scale)

Scale Guide:

- **4 (Excellent):** Exceeds expectations, highly detailed, and perfectly aligns with the project requirements.
- **3 (Good):** Meets the core requirements but may lack a slight amount of detail or have minor, non-critical flaws.
- **2 (Developing):** Partially meets requirements; contains significant vagueness, structural errors, or misses key components.
- **1 (Incomplete):** Fails to meet the basic requirements, is entirely missing, or is irrelevant to the course objectives.

Evaluation Criteria	4 - Excellent	3 - Good	2 - Developing	1 - Incomplete
1. Introduction & Overview	Provides a clear Project Title and an excellent overview of the dynamic web-based application. The Problem Statement is clearly defined, and the system scope is perfectly appropriate (not overly complicated).	Provides a title and overview. The problem statement is defined but could be slightly clearer. The scope is mostly appropriate.	Missing either the title, overview, or problem statement. Alternatively, the proposed system is far too simple or far too complicated for the project scope.	Missing all core introductory components or the proposal is entirely disconnected from building a dynamic web application.

2. Group Members & Task Distribution	Lists the Group Number and all members (maximum 3), with the Group Leader explicitly named . EACH group member is clearly assigned to work on one specific module individually.	Lists the group members (maximum 3) and modules, but the Group Leader is not explicitly named, OR the module assignments are slightly ambiguous.	Exceeds the maximum limit of 3 students, missing group member names, or modules are assigned to the whole group rather than distributed individually.	Fails to provide group details and completely fails to distribute module tasks among members.
3. Module Functionality (CRUD)	Proposes at least 3 modules (not including user registration). Explicitly states how every individual module performs general information management tasks using CRUD (Create, Retrieve, Update, Delete) functions.	Proposes at least 3 modules, but the description of the CRUD functionality for one or more modules lacks some clarity or detail.	Proposes fewer than 3 modules (excluding registration), OR the mandatory CRUD functionalities are only partially addressed.	Does not address the mandatory CRUD functionalities within the web application at all.

4. Use Case & Description	Provides an accurate Use Case diagram. Includes a highly detailed description outlining exactly how each member manages data for their respective modules, clearly demonstrating CRUD functionalities.	Provides a Use Case diagram with minor logical errors. The description explains data management but could be clearer on how CRUD operates.	Provides a Use Case diagram with major structural flaws, OR the description of data management and CRUD is very vague or missing.	Missing both the Use Case diagram and the accompanying description entirely.
5. Class Diagram (Model & Database)	Draws a clear Class diagram showing overall design/structure. Perfect database (Model) planning that determines exactly what data needs to be stored and explicitly defines specific data types .	Class diagram is provided but missing minor relationships. Database planning lists required data but misses specific data types for some attributes.	Class diagram has major structural flaws. Database planning is vague, failing to specify what data needs to be stored or completely lacking data types.	Missing Class diagram and database planning entirely.

6. User Interface (UI) Design	Excellent wireframes representing the GUI. Frontend (View) planning explicitly accounts for and distinguishes the use of HTML/JSP (structure), CSS (visual styling), and JavaScript (input validation).	Good wireframes provided. Mentions Frontend technologies but lacks clear distinction of their specific roles (structure, styling, validation).	Basic or incomplete wireframes. Fails to account for one or more of the required Frontend technologies (HTML/JSP, CSS, or JS).	Missing UI wireframes and Frontend technology planning completely.
